The following questions is about chapter 4 "Cache Memory":

1. A set-associative cache consists of 64 lines, or slots, divided into four-line sets. Main memory contains 4K blocks of 128 words each. Show the format of main memory addresses.

   **Answer:**
   The cache is divided into 16 sets of 4 lines each. Therefore, 4 bits are needed to identify the set number. Main memory consists of $4K = 2^{12}$ blocks. Therefore, the set plus tag lengths must be 12 bits and therefore the tag length is 8 bits. Each block contains 128 words. Therefore, 7 bits are needed to specify the word.

<table>
<thead>
<tr>
<th>TAG</th>
<th>SET</th>
<th>WORD</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>4</td>
<td>7</td>
</tr>
</tbody>
</table>

2. A two-way set-associative cache has lines of 16 bytes and a total size of 8 kbytes. The 64-Mbyte main memory is byte addressable. Show the format of main memory addresses.

   **Answer:**
   There are a total of 8 kbytes/16 bytes = 512 lines in the cache. Thus the cache consists of 256 sets of 2 lines each. Therefore 8 bits are needed to identify the set number. For the 64-Mbyte main memory, a 26-bit address is needed. Main memory consists of 64-Mbyte/16 bytes = $2^{22}$ blocks. Therefore, the set plus tag lengths must be 22 bits, so the tag length is 14 bits and the word field length is 4 bits.

<table>
<thead>
<tr>
<th>TAG</th>
<th>SET</th>
<th>WORD</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>8</td>
<td>4</td>
</tr>
</tbody>
</table>

3. For the hexadecimal main memory addresses 111111, 666666,BBBBBB, show the following information, in hexadecimal format:
   a. Tag, Line, and Word values for a direct-mapped cache, using the format of Figure 4.10.
   b. Tag and Word values for an associative cache, using the format of Figure 4.12.
   c. Tag, Set, and Word values for a two-way set-associative cache, using the format of Figure 4.15.

<table>
<thead>
<tr>
<th>Address</th>
<th>111111</th>
<th>666666</th>
<th>BBBBBB</th>
</tr>
</thead>
<tbody>
<tr>
<td>a.Tag/Line/Word</td>
<td>11 / 444 / 1</td>
<td>66 / 1999 / 2</td>
<td>BB / 2EEE / 3</td>
</tr>
<tr>
<td>b.Tag /Word</td>
<td>44444 / 1</td>
<td>199999 / 2</td>
<td>2EEEEE / 3</td>
</tr>
<tr>
<td>c.Tag/Set/Word</td>
<td>22 / 444 / 1</td>
<td>CC / 1999 / 2</td>
<td>177 / EEE / 3</td>
</tr>
</tbody>
</table>

4. Consider a machine with a byte addressable main memory of $2^{16}$ bytes and block size of 8 bytes.
   Assume that a direct mapped cache consisting of 32 lines is used with this machine.
   a. How is a 16-bit memory address divided into tag, line number, and byte number?
   b. Into what line would bytes with each of the following addresses be stored?
      0001 0001 0001 1011
      1100 0011 0011 0100
      1101 0000 0001 1101
      1010 1010 1010 1010
   c. Suppose the byte with address 0001 1010 0001 1010 is stored in the cache. What are the addresses of the other bytes stored along with it?
d. How many total bytes of memory can be stored in the cache?
e. Why is the tag also stored in the cache?

Answer:
a. 8 leftmost bits = tag; 5 middle bits = line number; 3 rightmost bits = byte number.

<table>
<thead>
<tr>
<th>TAG</th>
<th>LINE</th>
<th>WORD</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>5</td>
<td>3</td>
</tr>
</tbody>
</table>

b. Line 3.
   Line 6.
   Line 3.
   Line 21.

c. Bytes with addresses 0001 1010 0001 1000 through 0001 1010 0001 1111 are stored in the cache.

d. 256 bytes.

e. Because two items with two different memory addresses can be stored in the same place in the cache. The tag is used to distinguish between them.

5. Consider a memory system that uses a 32-bit address to address at the byte level, plus a cache that uses a 64-byte line size.
   a. Assume a direct mapped cache with a tag field in the address of 20 bits. Show the address format and determine the following parameters: number of addressable units, number of blocks in main memory, number of lines in cache, size of tag.
   b. Assume an associative cache. Show the address format and determine the following parameters: number of addressable units, number of blocks in main memory, number of lines in cache, size of tag.
   c. Assume a four-way set-associative cache with a tag field in the address of 9 bits. Show the address format and determine the following parameters: number of addressable units, number of blocks in main memory, number of lines in set, number of sets in cache, number of lines in cache, size of tag.

Answer:
a. Address format: Tag = 20 bits; Line = 6 bits; Word = 6 bits.
   Number of addressable units = \( 2^{w+w}\) = 2^{32} bytes; number of blocks in main memory = \( 2^s = 2^{26}\);
   Number of lines in cache \( 2^t = 2^6 = 64\); size of tag = 20 bits.

b. Address format: Tag = 26 bits; Word = 6 bits.
   Number of addressable units = \( 2^{w+w}\) = 2^{32} bytes; number of blocks in main memory = \( 2^s = 2^{26}\);
   Number of lines in cache = undetermined; size of tag = 26 bits.

c. Address format: Tag = 9 bits; Set = 17 bits; Word = 6 bits.
   Number of addressable units = \( 2^{w+w}\) = 2^{32} bytes; Number of blocks in main memory = \( 2^s = 2^{26}\);
   Number of lines in set = \( k = 4\); Number of sets in cache = \( 2^d = 2^{17}\); Number of lines in cache = \( k \times 2^d = 2^{19}\); Size of tag = 9 bits.
6. Consider a computer with the following characteristics: total of 1M byte of main memory; word size of 1 byte; block size of 16 bytes; and cache size of 64 Kbytes.
   a. For the main memory addresses of F0010, 01234, and CABBE, give the corresponding tag, cache line address, and word offsets for a direct-mapped cache.
   b. Give any two main memory addresses with different tags that map to the same cache slot for a direct-mapped cache.
   c. For the main memory addresses of F0010 and CABBE, give the corresponding tag and offset values for a fully-associative cache.
   d. For the main memory addresses of F0010 and CABBE, give the corresponding tag, cache set, and offset values for a two-way set-associative cache.

Answer:
   a. Because the block size is 16 bytes and the word size is 1 byte, this means there are 16 words per block. We will need 4 bits to indicate which word we want out of a block. Each cache line/slot matches a memory block. That means each cache line contains 16 bytes. If the cache is 64Kbytes then 64Kbytes/16 = 4096 cache lines. To address these 4096 cache lines, we need 12 bits (2^12 = 4096).
Consequently, given a 20 bit (1 MByte) main memory address:
   Bits 0-3 indicate the word offset (4 bits).
   Bits 4-15 indicate the cache line/slot (12 bits).
   Bits 16-19 indicate the tag (remaining bits).

   \[F0010 = 1111 0000 0000 0001 0000\]
   Word offset = 0000 = 0
   line = 0000 0000 0001 = 001
   Tag = 1111 = F

   \[01234 = 0000 0001 0010 0011 0100\]
   Word offset = 0100 = 4
   Line = 0001 0010 0011 = 123
   Tag = 0000 = 0

   \[CABBE = 1100 1010 1011 1011 1110\]
   Word offset = 1110 = E
   Line = 1010 1011 1011 = ABB
   Tag = 1100 = C

   b. We need to pick any address where the line is the same, but the tag (and optionally, the word offset) is different. Here are two examples where the line is 1111 1111 1111
   Address 1:
      Word offset = 1111
      Line = 1111 1111 1111
      Tag = 0000
      Address = 0FFFF

   Address 2:
      Word offset = 0001
      Line = 1111 1111 1111
      Tag = 0011
      Address = 3FFF1
c. With a fully associative cache, the cache is split up into a TAG and a WORDOFFSET field. We no longer need to identify which line a memory block might map to, because a block can be in any line and we will search each cache line in parallel. The word-offset must be 4 bits to address each individual word in the 16-word block. This leaves 16 bits leftover for the tag.

F0010
Word offset = 0h
Tag = F001h
CABBE
Word offset = Eh
Tag = CABBh

d. As computed in part a, we have 4096 cache lines. If we implement a two-way set associative cache, then it means that we put two cache lines into one set. Our cache now holds 4096/2 = 2048 sets, where each set has two lines. To address these 2048 sets we need 11 bits (211 = 2048). Once we address a set, we will simultaneously search both cache lines to see if one has a tag that matches the target. Our 20-bit address is now broken up as follows:

Bits 0-3 indicate the word offset
Bits 4-14 indicate the cache set
Bits 15-20 indicate the tag

\[ F0010 = 1111 0000 0000 0001 0000 \]
Word offset = 0000 = 0
Cache Set = 000 0000 0001 = 001
Tag = 11110 = 1 1110 = 1E

\[ CABBE = 1100 1010 1011 1011 1110 \]
Word offset = 1110 = E
Cache Set = 010 1011 1011 = 2BB
Tag = 11001 = 1 1001 = 19

The following questions is about chapter 5 "Internal Memory":

1. For the Hamming code shown in Figure 5.10, show what happens when a check bit (of bit position 8) rather than a data bit is in error?

Answer:
The stored word is 001101001111, as shown in Figure 5.10. Now suppose that the only error is in C8, so that the fetched word is 001111001111. Then the received block results in the following table:

<table>
<thead>
<tr>
<th>Position</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits</td>
<td>D8</td>
<td>D7</td>
<td>D6</td>
<td>D5</td>
<td>C8</td>
<td>D4</td>
<td>D3</td>
<td>D2</td>
<td>C4</td>
<td>D1</td>
<td>C2</td>
<td>C1</td>
</tr>
<tr>
<td>Block</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Codes</td>
<td>1010</td>
<td>1001</td>
<td>0111</td>
<td></td>
<td>0011</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The check bit calculation after reception:

<table>
<thead>
<tr>
<th>Position</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hamming</td>
<td>1111</td>
</tr>
<tr>
<td>10</td>
<td>1010</td>
</tr>
<tr>
<td>9</td>
<td>1001</td>
</tr>
<tr>
<td>7</td>
<td>0111</td>
</tr>
<tr>
<td>3</td>
<td>0011</td>
</tr>
<tr>
<td>XOR = syndrome</td>
<td>1000</td>
</tr>
</tbody>
</table>

The nonzero result detects and error and indicates that the error is in bit position 8, which is check bit C8.
2. Suppose an 8-bit data word stored in memory is 11000010. Using the Hamming algorithm, determine what check bits would be stored in memory with the data word. Show how you got your answer.

**Answer:**

Data bits with value 1 are in bit positions 12, 11, 5, 4, 2, and 1:

<table>
<thead>
<tr>
<th>Position</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits</td>
<td>D8</td>
<td>D7</td>
<td>D6</td>
<td>D5</td>
<td>C8</td>
<td>D4</td>
<td>D3</td>
<td>D2</td>
<td>C4</td>
<td>D1</td>
<td>C2</td>
<td>C1</td>
</tr>
<tr>
<td>Block</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Codes</td>
<td>1100</td>
<td>1011</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0101</td>
</tr>
</tbody>
</table>

The check bits are in bit numbers 8, 4, 2, and 1.
Check bit 8 calculated by values in bit numbers: 12, 11, 10 and 9
Check bit 4 calculated by values in bit numbers: 12, 7, 6, and 5
Check bit 2 calculated by values in bit numbers: 11, 10, 7, 6 and 3
Check bit 1 calculated by values in bit numbers: 11, 9, 7, 5 and 3
Thus, the check bits are: 0 0 1 0

3. For the 8-bit word 00111001, the check bits stored with it would be 0111. Suppose when the word is read from memory, the check bits are calculated to be 1101. What is the data word that was read from memory?

**Answer:**

The Hamming Word initially calculated was:

<table>
<thead>
<tr>
<th>bit number:</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

Doing an exclusive-OR of 0111 and 1101 yields 1010 indicating an error in bit 10 of the Hamming Word. Thus, the data word read from memory was 00011001.

4. How many check bits are needed if the Hamming error correction code is used to detect single bit errors in a 1024-bit data word?

**Answer:**

Need K check bits such that \(2^K - 1 \geq 1024 + K\).
The minimum value of K that satisfies this condition is 11.
